## Student Grades

A teacher wants to record the grades of 4 students and see who passed or  failed. A student passes if their grade is 10 or higher.

We want to write a program that will read a positive integer  $N$  for each of the 4 students from the input `STDIN` .

The program will print ( `STDOUT` ) the message `Passed` if the grade is 10 or higher, otherwise, it will print the message `Failed` .

## Examples

### Input

```
10
9
20
6
```

### Output

```
Passed
Failed
Passed
Failed
```
